Windows allows users to schedule specific applications that run automatically at specific times. This is called "background processing" or "Task Scheduler." A problem arises when dealing with services. By their very nature, services can be considered background processes. Services are available to all of your applications and activities in the background. It is common for Windows desktop applications to need to run services on a regular basis without interaction. Services run in the background without your awareness. While the services are there, their state (enabled or disabled) is hidden to the user. The problem is, the Task Scheduler has no equivalent functionality. This is because the Task Scheduler can only schedule tasks that are located on the local computer. A task is not a service

Review-on-windows: This is, on the one hand, a very nice tool, with a good interface, that should be sufficient for basic deployment tasks. It works quite well. However, it is missing some important functionality. There is no remote deployment functionality, no type conversion, no color-scheme support, no charting, no data export in various formats, no "hidden" data. But above all, there is no automatic update functionality, which is something that I really miss in this application. Extras: I do have some extra extras, which are not installed by default, and therefore not accessible in the main window. There are, however, installation instructions on the "Additional extras" page. Manual update location: License: The application is licensed under the GNU GPLv3 license. This means that you're free to use it, but you have to share your changes with the world.
